CVC Meeting—Tuesday, January 11, 2011
No Board Meeting
6:00 PM—no host dinner

6:00 PM—no host dinner 7:00 PM Meeting AT

Apollo's Pizza and Pub 2010 Harrison Ave. NW, Olympia

Scary Facts - Sitting Too Much Will Kill You

The evidence is mounting that all of those lifestyle steps you put on your pedometer when you aren't purposefully exercising may be saving your life. Even if you logged 10,000 steps a day with a brisk hour's walk, but sat most of the rest of the day, you are at a higher risk of death: <u>Sit still, die younger</u>

The latest blast against sitting too much comes via a great article in in *Men's Health* by Maria Masters - Why sitting all day is slowly killing you. She interviews researchers whose findings I've been reporting on for the past two years. Lack of non-exercise activity is a risk factor for heart disease, even if you exercise enough. It's not enough to get in that good walk once a day -- you need to find ways to move around more within the day.

Besides the risk of heart disease, Masters covers how sitting leads to "muscle stiffness, poor balance and mobility, and lower-back, neck, and hip pain." It tightens the hip flexors and gives your glutes amnesia.

Many people have taken to wearing toning shoes as one way to combat these effects of sitting still for much of the work-

day. Toning shoes claim to work the glutes more. I also use an <u>balance disk as a seat cushion</u>, which functions much like an <u>exercise ball chair</u> to give some imbalance and activation to my core muscles while sitting. I probably won't convert to a <u>treadmill desk</u>, but a <u>standing desk</u> might not be a bad idea (and easy to do with my adjustable height IKEA home office furniture).

But the best solution is to find ways to get up, stretch and move around every half hour. Wear a pedometer to keep yourself honest about it. Yesterday I was working on a data project and logged fewer than 1000 steps in six hours. Is that the Grim Reaper I see behind me?

Build the Walking Habit

By Wendy Bumgardner,

It is time to commit yourself to better health, fitness, and a body you love. To make this a reality, we have tools you can use to help you build and keep your walking habit.

There are four facets to setting up a new habit for a lifetime.

First, clear and realistic goals.

Second, keeping yourself on a schedule so that the habit sticks.

Third, monitoring your progress and rewarding yourself for success.

Fourth, keeping it interesting.

When Walking isn't working

Walking has always been highly recommended by doctors as a great form of exercise. But what the medical profession and even some trainers have collectively have failed to do, is explain just how to walk. The directive of "Walk 30 minutes a day," is too abstract.

Are You House-Walking rather than Fitness Walking?

Observe walkers on a popular outdoor path. Many peoples' idea of a "fitness walk" is that of strolling, while absorbed in heavy conversation. This does little to generate fitness results or trigger weight loss beyond the first 5 or 10 pounds.

This is "house-walking," the speed people walk when going from one room in the house to the other. They simply duplicate this and prolong it outdoors, hoping it will knock off 50 pounds, or make their legs miniskirt-ready, or clean out their clogged arteries.

Know Your Baseline

Your body transforms only when it detects a change in its normal routine. Your baseline is that level of physical activity that your body is highly accustomed to. It includes the speed at which you normally walk in everyday life. If you go this same pace on your designated fitness walks—even for 60 minutes—your body isn't going to detect much of a change.

You must perform above your baseline in order to ignite substantial changes in your body. Whatever your normal walking pace is in life, if you're doing this around that giant lake path, expect only minor changes and a soon-hit plateau.

Increase Intensity to Burn Stubborn Fat

The body that's used to house-walking is in for a real shock when it is suddenly moved at 4.2 mph! This will force your body's systems to jump into the trenches to carry out this unexpected task.

Carrying out this new challenge requires energy. Your body will dip into stored fat for this energy! You must exercise well-above your baseline to sheer off stubborn fat, or acquire higher resistance to heart disease and cancer.

Exercise Intensity Is Relative

If you are new to exercise walking, don't scorch yourself on the first day of training by attempting 4.2

mph. You must build a fitness base first. And once you get this, you must always keep pushing yourself. Remember, you've been walking since diaper days. Your body is so familiar with walking, that you must make it truly challenging for results. Know Your Starting Point: Everybody has a starting point: that which requires effort and an increased rate of breathing. For apparently healthy people of all ages, the starting point should be whatever it takes to achieve 60-85 percent target heart rate. If walking slowly for 30 minutes wipes you out, then this is your starting point. But commit yourself to going a little e a c h faster t i m e. Pay Attention to How you Feel: how hard you're breathing, and whether or not conversation comes easily. Find the pace that prevents you from carrying on conversation while still able to spead in short sentences, and then build up from there.

Know When You Can Add Intensity: As long as you're able to speak freely to your walking partner or into your cell phone, you can certainly add some intensity, regardless of your weight, age or athletic background. When a person, despite excess weight or advanced age, looks comfortable while walking, and especially if she or he is talking freely, this indicates they can walk a heck of a lot faster (unless they have painful knee joints, foot pain or painful leg vascular disease).

Get Out of Your Comfort Zone

In general, house-walkers are not hampered by pain; they're hampered by ignorance, believing that "Anything is better than nothing."

This reasoning is flawed. There's no such thing as "nothing." Get out of your comfort zone! Hardcore effort, not house-walking, will improve your red blood cells' ability to extract oxygen molecules from hemoglobin and transport them to working muscles. Do not settle. Expect more from the time you put into walking.

Beyond the Honeymoon

Of course you'll experience changes during the so-called honeymoon phase of your new walking program if you've previously been very inactive. Coupled with a sudden commitment to dieting, a 30-minute daily house-walk will produce some weight loss and maybe heightened liveliness. But you'll soon plateau and wonder, what's the point? The honeymoon phase is brief. Always aim for higher levels.

The Capitol Volkssport Club (CVC) of Olympia, Washington is a non profit organization dedicated to promoting public health, fun, recreation, and fellowship through non-competitive walking, biking, swimming or cross country skiing events. Membership is open to all. The American Volkssport Association (AVA), to which all Volkssporting clubs in the United States belong, is one of 54 countries that make the International Peoples Sports Club (IVV). The AVA's network of 305 Walking clubs organize more than 3,000 walking events as well as occasional bikes, skis, and swims every year in most of our 50 states.

Yearly CVC dues are;

\$8.00 (individual) per year; \$6.00 for 62+; \$12.00 for family. Only \$2.00 charge for our club's YRE. Membership for returning/ongoing members is July. Send membership dues to: **CVC**, **P.O.**
